Synthetic example — these are invented answers, not your personal results.

YOUR BIG FIVE REPORT

Your personality. In context.

Explore your patterns, the situations that shape them, and small steps you can try.

This report describes patterns in how you answered 120 personality statements. Treat each interpretation as a starting point to check against your experience. Your five broad traits bring together more specific facets, so a single trait score can hide meaningful differences. Work and everyday-life suggestions are optional experiments: keep what helps, adjust what does not, and consider the situation as well as your preferences.

Your five traits

Openness 3.17 / 5

Lower endorsement Higher endorsement

Conscientiousness 2.79 / 5

Lower endorsement Higher endorsement

Extraversion 3.46 / 5

Emotional reactivity (Neuroticism) 2.79 / 5

Lower endorsement Higher endorsement

The bigger picture

Read your traits together. A preference that helps in one setting can work differently in another. Your own examples are an essential part of this report.

These scales describe your answers, not your rank among other people. The bar maps the mean from 1 to 5 onto its possible range; it is not a percentile. Traits are tendencies, and context matters.

This is a self-reflection tool, not a diagnosis, ability test, or recommendation for a particular job. Results reflect your self-reported answers today.

How to read this report

- Scores summarize your own answers at this time. Mood, recent experiences, language, and the setting can affect responses; this report is not a fixed definition of you.
- Lower, middle, and higher describe your keyed response mean on the 1–5 scale. The editorial bands are below 2.5, 2.5 through 3.5 inclusive, and above 3.5. They are not population rankings, percentiles, or validated cutoffs.
- This is an adult self-reflection report, not a clinical assessment. Facets called Anxiety and Depression do not establish a mental health condition or rule one out.
- No trait level is universally better. Strengths and difficulties depend on your responsibilities, relationships, resources, and environment.
- Work suggestions do not predict performance, select a career, or establish suitability for employment. Life suggestions are editorial hypotheses, not validated interventions or treatment advice.
- Each facet uses four items. Read small score differences cautiously, especially near a band boundary; no confidence interval or reliable-change estimate is provided.
- Intellect does not measure IQ, Morality does not measure moral worth, and Liberalism does not identify a political party. These are historical facet labels with narrower meanings explained in the report.
- The report uses predefined editorial rules. It does not infer a unique personality type, diagnose you, or make validated predictions from combinations of traits.
- Some Liberalism items directly concern political beliefs and originate in a particular cultural context. Treat these answers as sensitive. A Norwegian translation does not establish cultural equivalence or Norwegian norms.

02

Your five traits

Each broad trait brings together six narrower facets. Four items per facet give a useful starting point, with more uncertainty than the broad scales.

Openness

MIXED / MIDDLE · 3.17 / 5

Openness covers imagination, aesthetic interests, attention to feelings, willingness to try unfamiliar activities, intellectual exploration, and questioning convention. It describes reported preferences, not intelligence, expertise, creativity as an achievement, or political identity.

Your response mean lies in the middle band for openness. You may seek novelty in selected areas while preferring familiar approaches elsewhere. Read the facets to distinguish intellectual curiosity, imagination, aesthetics, and willingness to change routines.

A POSSIBLE STRENGTH

You may have examples of combining an established method with one new element. That can be useful when a situation calls for exploration without replacing everything that already works.

SOMETHING TO NOTICE

Your appetite for novelty may depend on the subject. Do not assume that enjoying new ideas means enjoying changes to your schedule, or that familiar routines imply little curiosity.

The details within this trait

Imagination

Reported engagement with fantasy and imagined possibilities.

HIGHER ENDORSEMENT · 3.75 / 5

You may readily imagine alternatives. Capture a promising idea in a small practical form to see what it offers.

Artistic Interests

Reported appreciation of art, beauty, and aesthetic experiences; it does not measure artistic ability.

MIXED / MIDDLE · 2.75 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: Artistic experiences may be a smaller part of your interests. This says nothing about your ability to learn an art or craft.

Higher: Aesthetic experiences may matter to you. Consider making intentional room for the forms you actually enjoy.

Emotionality

Reported awareness of and attention to one's feelings; this differs from emotional distress or empathy.

LOWER ENDORSEMENT · 1.25 / 5

You may give feelings less attention when describing experience. Naming a feeling can sometimes clarify what matters in a decision.

Adventurousness

Reported willingness to try unfamiliar activities and depart from routine.

MIXED / MIDDLE · 3.25 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: Familiar activities may appeal more. If a change is needed, a small trial can make the experience easier to evaluate.

Higher: You may welcome unfamiliar experiences. Check whether a shared change also works for the people affected by it.

Intellect

A historical label for interest in abstract ideas and intellectual exploration; this is not an IQ or ability score.

HIGHER ENDORSEMENT · 4.25 / 5

You may enjoy exploring complex ideas. Translate your reasoning into a concrete example when communicating it to others.

Liberalism

A historical facet combining political and conventional beliefs, including liberal or conservative candidates, crime policy, and absolute right and wrong. These culturally specific items do not establish party membership or voting behavior.

HIGHER ENDORSEMENT · 3.75 / 5

You may be inclined to question conventions. Explain what a proposed alternative would improve and how it could be evaluated.

Conscientiousness

MIXED / MIDDLE · 2.79 / 5

Conscientiousness covers perceived effectiveness, order, responsibility, striving, persistence, and deliberation. It describes reported habits and preferences. It does not establish competence, personal value, or how reliably someone will perform in every environment.

Your response mean is in the middle band for conscientiousness. You may use structure in some areas and a looser approach in others. A tidy environment, strong ambition, and steady follow-through are distinct facets and need not move together.

A POSSIBLE STRENGTH

You may have experience using plans when they help and adjusting them when circumstances change. Identify where that approach has worked rather than assuming the average describes every responsibility.

SOMETHING TO NOTICE

A system that works for an interesting project may be less effective for routine maintenance. Notice whether particular kinds of tasks repeatedly fall outside your usual planning habits.

The details within this trait

Self-Efficacy

Reported belief in one's ability to handle tasks effectively; it does not directly measure competence.

MIXED / MIDDLE · 3.00 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may feel less certain of your effectiveness. Review one specific task and identify what knowledge or support would help.

Higher: You may feel capable of handling tasks. Check that your confidence is supported by the information and preparation this task requires.

Orderliness

Reported preference for organization, tidiness, and structured surroundings.

MIXED / MIDDLE · 3.25 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may tolerate a less structured environment. Use a simple place or reminder for items whose loss creates real friction.

Higher: You may prefer clear organization. Distinguish the structure that helps from details that others need not arrange your way.

Dutifulness

Reported commitment to obligations and rules; it does not establish trustworthiness in every situation.

MIXED / MIDDLE · 2.75 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may treat obligations or rules more flexibly. Clarify commitments others rely on before changing them.

Higher: You may take obligations seriously. Revisit an agreement openly when changed circumstances make the original commitment unrealistic.

Achievement-Striving

Reported drive to meet ambitious standards and pursue accomplishment.

LOWER ENDORSEMENT · 1.25 / 5

Ambitious achievement may be less central to your priorities. Define success around what you actually value and need to accomplish.

Self-Discipline

Reported ability to begin and persist with tasks despite boredom or distraction.

LOWER ENDORSEMENT · 2.25 / 5

You may find some tasks difficult to start or sustain. Try a small first action with a visible cue and a short work period.

Cautiousness

Reported tendency to deliberate before acting; it does not measure decision accuracy.

HIGHER ENDORSEMENT · 4.25 / 5

You may weigh decisions carefully. Set a decision deadline when further information is unlikely to change the choice.

Extraversion

MIXED / MIDDLE · 3.46 / 5

Extraversion covers social engagement, assertiveness, activity, excitement seeking, and positive emotional expression. Enjoying company, speaking up, and enjoying stimulation are related but distinct preferences. A lower mean does not establish shyness or poor social skills.

Your response mean falls in the middle band for extraversion. You may enjoy social contact in some settings and prefer quiet in others. The average can also reflect strong preferences in opposite directions across the facets.

A POSSIBLE STRENGTH

You may have examples of enjoying both collaboration and independent time. Identifying the conditions that support each is more useful than expecting yourself to switch comfortably in every situation.

SOMETHING TO NOTICE

A schedule can accumulate more interaction or solitude than you intended. Your preferred mix may shift with the activity, the people involved, and other demands on your attention.

The details within this trait

Friendliness

Reported warmth and ease in approaching people; it does not measure kindness.

HIGHER ENDORSEMENT · 3.75 / 5

You may readily express warmth. Check whether a new acquaintance welcomes the same pace of connection.

Gregariousness

Reported preference for company, groups, and social gatherings.

HIGHER ENDORSEMENT · 3.75 / 5

You may enjoy frequent company and groups. Plan social time while checking that quieter commitments also get attention.

Assertiveness

Reported willingness to speak up, take charge, and influence group direction.

MIXED / MIDDLE · 3.50 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may be less inclined to take the lead. Prepare one clear request or contribution when your perspective needs to be heard.

Higher: You may readily influence a discussion. Invite an alternative view before treating your preferred direction as the group's decision.

Activity Level

Reported preference for a busy pace and active involvement; this is not a measure of health or productivity.

HIGHER ENDORSEMENT · 3.75 / 5

You may enjoy a full, active schedule. Check whether the pace leaves enough room to finish tasks and respond to surprises.

Excitement-Seeking

Reported appetite for stimulation and exciting experiences; it does not establish reckless behavior.

MIXED / MIDDLE · 3.25 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may prefer less intense stimulation. Choose settings that let you engage comfortably without assuming novelty will be unpleasant.

Higher: You may enjoy stimulating experiences. Consider the practical consequences separately from how exciting an option feels.

Cheerfulness

Reported tendency to experience and express positive feelings; it is not a complete measure of well-being.

MIXED / MIDDLE · 2.75 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You endorsed fewer strongly upbeat statements. A quieter emotional style does not mean you cannot enjoy meaningful experiences.

Higher: You endorsed more upbeat statements. Your enthusiasm may be welcome; also leave space for someone else's disappointment or concern.

Agreeableness

MIXED / MIDDLE · 2.88 / 5

Agreeableness covers trust, straightforwardness, helping, cooperation, modesty, and sympathetic concern. It describes tendencies in relating to others, not goodness, moral worth, relationship quality, or the absence of healthy disagreement.

Your answers fall in the middle band for agreeableness. You may value cooperation while also being willing to protect your interests. This mean can represent different mixtures of trust, helping, modesty, and willingness to compromise.

A POSSIBLE STRENGTH

You may have examples of both accommodating another person and holding your ground. Examining what guided those choices can help you make future decisions more intentional and easier to explain.

SOMETHING TO NOTICE

Your response may change with the stakes or the relationship. Others can find it difficult to predict your boundaries if those boundaries become visible only after you are frustrated.

The details within this trait

Trust

Reported expectation that other people generally have good intentions.

LOWER ENDORSEMENT · 1.25 / 5

You may be cautious about others' intentions. Look for observable evidence before drawing a conclusion about a particular person.

Morality

A historical label concerning reported straightforwardness versus strategic self-presentation; it does not measure moral worth.

HIGHER ENDORSEMENT · 4.25 / 5

You may favor straightforward communication. Consider timing and privacy as well as candor when sharing sensitive information.

Altruism

Reported willingness to help others and enjoyment of being useful.

HIGHER ENDORSEMENT · 3.75 / 5

You may readily offer help. Check what the person actually wants and what you can sustainably provide.

Cooperation

Reported willingness to compromise and avoid interpersonal confrontation.

MIXED / MIDDLE · 3.00 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may be willing to confront disagreement. Focus the challenge on the issue and keep a route to resolution open.

Higher: You may prefer compromise. State an important concern early so agreement reflects your needs as well as others'.

Modesty

Reported comfort with self-promotion and claims of personal superiority; it is not a measure of confidence or worth.

LOWER ENDORSEMENT · 2.25 / 5

You may be comfortable highlighting your strengths. Use concrete evidence and acknowledge others' contributions when describing success.

Sympathy

Reported tender concern for others and attention to their difficulties.

MIXED / MIDDLE · 2.75 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You may put more weight on detached or practical considerations. Ask about the personal impact before deciding what help is useful.

Higher: You may be strongly moved by others' difficulties. Clarify what support is wanted and which responsibilities you can reasonably take on.

Emotional reactivity (Neuroticism)

MIXED / MIDDLE · 2.79 / 5

This trait summarizes reported tendencies toward worry, emotional discomfort, and feeling overwhelmed. Its facets cover different experiences; a broad score should not replace reading those details. A higher response mean is not a diagnosis, and a lower mean does not mean you never experience distress.

Your answers sit around the middle of the response scale for emotional reactivity. You may recognize some worry or sensitivity alongside periods of steadiness. Different situations or sharply different facet scores could produce this same average.

A POSSIBLE STRENGTH

You may find occasions when concern prompts preparation and others when you can let uncertainty remain unresolved. Look for specific examples of each rather than assuming a consistent balance.

SOMETHING TO NOTICE

An average can hide recurring pressure points. A demanding deadline, social evaluation, or lack of sleep may matter more to your experience than the broad label suggests.

The details within this trait

Anxiety

Reported tendency to anticipate threats or feel worried; this facet is not a clinical anxiety assessment.

MIXED / MIDDLE · 3.25 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You endorsed fewer worry-related statements. Check important risks explicitly even when you feel comfortable.

Higher: You endorsed more worry-related statements. Try separating a concrete concern from an unanswered question before deciding what to do.

Anger

Reported tendency to feel irritated or angry when things go wrong; it does not establish aggressive behavior.

LOWER ENDORSEMENT · 2.25 / 5

You report relatively little irritation. If a problem matters, state it clearly even when you do not feel angry.

Depression

A historical facet label for reported discouragement, sadness, or low spirits; it cannot diagnose or rule out depression.

LOWER ENDORSEMENT · 1.25 / 5

You endorsed fewer low-spirited statements. This does not mean every period of life feels easy or positive.

Self-Consciousness

Reported discomfort with social evaluation or being the focus of attention.

MIXED / MIDDLE · 2.75 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You report less discomfort with being noticed. Others may need more preparation before being put on the spot.

Higher: You report more discomfort with evaluation. Preparing one contribution in advance may make a specific social task feel more manageable.

Immoderation

Reported difficulty resisting urges or temptations; this is not a diagnosis of addiction or a judgment of character.

HIGHER ENDORSEMENT · 3.75 / 5

You report more difficulty resisting some urges. For one everyday temptation, try making your preferred choice easier to access.

Vulnerability

Reported tendency to feel overwhelmed or less able to cope under pressure.

MIXED / MIDDLE · 3.50 / 5

Your responses sit near the middle of this scale. Both of the following tendencies may show up in different situations.

Lower: You report feeling relatively capable under pressure. Still check whether you need information, rest, or help for the particular situation.

Higher: You report more difficulty under pressure. Breaking one demand into a next step and clarifying available support may be worth trying.

03

Work & career

Use these ideas to explore how you work, rather than to choose a job title.

MIXED / MIDDLE

Openness

For a decision with several options, compare one established approach with one alternative. Use the same criteria for both, including effort, uncertainty, and the problem you need to solve.

MIXED / MIDDLE

Conscientiousness

Match the amount of structure to the consequence of a missed step. A simple checklist may be enough for a repeatable task, while a complex handoff needs explicit ownership and timing.

MIXED / MIDDLE

Extraversion

Group related meetings where possible, then leave room to complete the work they create. Notice whether your best contributions come during discussion, preparation, or later reflection.

MIXED / MIDDLE

Agreeableness

Before a negotiation, identify what is essential, what is flexible, and what you need to understand. This makes it easier to cooperate without losing track of your responsibilities.

MIXED / MIDDLE

Emotional reactivity (Neuroticism)

Identify the two work situations that tend to create the most friction. Decide in advance what information, preparation, or support would make each easier to handle.

04

Everyday life

Notice what fits your life, and adapt what you try to the people and situations around you.

MIXED / MIDDLE

Openness

Tell others where you enjoy surprise and where advance notice helps. Specific preferences are easier to accommodate than a broad claim that you are either spontaneous or routine-oriented.

MIXED / MIDDLE

Conscientiousness

Choose a few recurring commitments that deserve reliable reminders. Leave flexibility elsewhere so planning supports what matters without filling every available hour.

MIXED / MIDDLE

Extraversion

Before accepting another invitation, consider what the rest of the week already contains. Make room for both connection and the amount of unstructured time you find useful.

MIXED / MIDDLE

Agreeableness

Make requests and limits specific. Saying what you can offer, when you can offer it, and what you cannot take on gives others usable information.

MIXED / MIDDLE

Emotional reactivity (Neuroticism)

Let close people know what helps when you are under pressure. Preferences can vary: sometimes you may want practical help, and sometimes space to describe the problem.

05

Three small steps to try

Begin with one. Try it for a week, then ask what changed. These suggestions follow your strongest departures from the scale midpoint, not a prediction of what will work.

01 · EXTRAVERSION · MIXED / MIDDLE

An experiment for this week

For five days, note the amount and kind of interaction you had and how you felt afterward. Change one element next week and check whether the adjustment helps.

Reflect: What happened? What helped? What would you change next time?

02 · CONSCIENTIOUSNESS · MIXED / MIDDLE

An experiment for this week

Compare one task you finished smoothly with one you postponed. Note clarity, timing, interest, and interruptions. Apply one helpful condition from the first task to the next difficult one.

Reflect: What happened? What helped? What would you change next time?

03 · EMOTIONAL REACTIVITY (NEUROTICISM) · MIXED / MIDDLE

An experiment for this week

Track three stressful and three manageable situations this week. Note the demands, available support, and your response. Look for a repeatable difference before changing your routine.

Reflect: What happened? What helped? What would you change next time?

A score is a prompt for curiosity. Keep the parts that help you make a useful observation, and revisit your conclusions as you learn more.
